Visible judgment.

The proposed direction presents OpusClip as an AI video agent whose decisions can be seen and understood. The homepage is composed of real vertical footage shown in greyscale, and colour is restored only to the clip the agent selects, accompanied by the reason for its selection. Each claim the brand makes is supported by evidence on the same page.

Current homepage: a centred headline, a link input and a product demonstration card.

Proposed homepage: drifting columns of footage, with the selected clip shown in colour.

Visual direction

The palette consists of a true black field, a warm paper tone for reading sections, and the footage itself. Columns of vertical clips move in alternating directions, reflecting the format in which short video is consumed. A single cobalt accent is reserved for one meaning throughout the system: a clip the agent has selected. The page itself scrolls like YouTube Shorts and Instagram Reels, one full-screen section at a time.

Headlines are set in Familjen Grotesk and body text in Schibsted Grotesk. Both are grotesque typefaces with an editorial character, which gives the brand a voice distinct from the interface typefaces common across AI software.

Tone and motion

The intended impression is that of an editing suite: composed, precise and assured. Motion is used only where it communicates a decision. When the agent selects a clip, crop marks draw around it, its colour returns, playback begins and a short explanation appears.

Guiding principle

The work of the agent should be visible. The creator's footage remains the primary subject, and the agent's contribution is shown alongside it with a clear rationale.

Rationale for the current stage

Company stage. OpusClip is expanding from a clipping tool into an AI video agent, with ClipAnything, ReframeAnything, AI Producer and Agent Opus. The brand should express this broader capability and the judgment that underpins it.

Competitive position. Klap, Vizard and Submagic make similar promises of speed and virality, and they question the reliability of OpusClip's virality score. Presenting the reasoning behind each score addresses this directly.

Audience and growth. In addition to more than 20 million creators, growth increasingly comes from teams and businesses that rely on brand templates, shared workspaces, scheduling and SOC 2 Type 2 compliance. These buyers place a high value on control, consistency and trust.

Current brand and proposed direction

	Current brand	Proposed direction
First impression	A centred headline above a product demonstration, a layout shared by many AI tools.	A wall of real vertical footage, so that visitors see the output before reading any copy.
Colour	Black and white, with no colour assigned a specific meaning.	Greyscale footage and a single cobalt accent that consistently indicates a selected clip.
Typography	Geist, a typeface widely used across developer tools.	Familjen Grotesk and Schibsted Grotesk, set tightly with an editorial character.
Claims	"#1", "viral" and "10x" are presented largely on their own.	The same claims are retained and paired with evidence: the 20M+ user base, named creators and their published analytics.
Virality score	Presented as a single number.	Presented with its Hook, Flow, Value and Trend grades and the passage of the video that earned them.
Motion	Carousels and standard hover states.	One signature interaction, the selection of a clip, applied wherever the agent makes a choice.
Site and product	The product interface uses charcoal and cyan, which differ from the marketing site.	A single system shared by both, with the product adopting the selection language in a later phase.

Retained elements

The OpusClip name and logomark are retained, together with the established claims ("#1 AI video clipping tool", "1 long video, 10 viral clips" and "Used by 20M+ creators and businesses"), the creator roster, all published testimonials, and the SOC 2 and G2 badges. The rebrand changes how these facts are presented while leaving the facts themselves unchanged.

Production approach

Page frames are designed in Figma. Layout, scroll behaviour, the drifting footage columns and hover states are built with Webflow Interactions. The clip selection is a single Rive state machine with four states (idle, selecting, selected and released) that can be applied to any clip. The homepage can therefore be produced without custom engineering.

Measures of success

Recognition. A greyscale wall with a single clip in colour should be identifiable as OpusClip in a screenshot, even without the logo.

Trust. Prospective team customers should be able to understand why a clip was chosen before committing to a paid plan.

Extensibility. Because the selection is defined as a behaviour, it can be applied consistently across advertising, launch pages, the product interface and social channels.

Footage on the proof-of-concept page is stock material used for illustration. Creator images, quotes and badges are sourced from opus.pro.
